## "Economic view of Environmental Consumption"

Dr. Onkar Balkrishna Khiste

Dept. of Economics

Shri Sant Gajajnan Mahavidyalaya, Kharda Tal. Jamkhed, Dist. Ahmednagar

### Key words:

Economic view, Consumption, Environment, impact of consumption...

### Introduction:

In this research paper we are thinking about consumption of environment in the form of economic goods. Which is the most important who is determinant of status of environment and it depends upon our view of consumption. What are the characteristics of goods? It determines types of goods. The type of goods determines psychology of person how to consume goods. Some types of goods studies in economics like as public goods, private goods, merit goods, same public goods, necessary goods etc. but we are considering here two types of goods for supporting to analysis which are Public goods and private goods. Naturally every person differently thinking about consumption about public goods and private goods. Unknowingly private goods we are use or consume economically, efficiently and carefully appositely public goods use with careless. When we think about present adverse situation of environment this becoming mode of lake of consciousness about environment because in the flow of rapidly growing population, globalization, and changing mode of consumption etc. all reasons are unenthusiastically affecting to environment in the other words we can say we are consuming of environment as a luxury goods so that we have to stop effectively the flow of population and globalization as well as we have to consume environment as a public goods. We should change our consumption pattern, habits which are helpful to conservation of environment!

### Objectives:

1. To take review of pattern of consumption about environment.
2. To analysis, is environment a public goods?

### Definition of public goods:

Here first define the what is public goods for this concept defined on the bases of characteristics like (1) We cannot exclude to any one from consumption (Common consumption) In the word of Prof. Dalton "public goods enjoy with group" (2) public goods are indivisible. (3) it provided without any consideration or free of cost (no existence of market mechanism). (4) there is lack of law of exclusion etc. in the short word there is no any restrictions in the consumption of public goods so that environment is a public goods. In age of globalization every one consumes environment as a public goods with irrationally and careless. So that environmental situation is day by day going on deprivation.

### Environmentconsumption patter:

What is the situation of environment in the historical period? In the age of past every alive had consuming pure or healthy environment as public goods so that every healthy life. In

the lack of industrialization circumstances of person had imitated and it's in control, every alive depend on nature so that relationship between environment and alive was very positive and strong as well as it was jointed with heart! So that people consumed environmental goods as a private goods.

Another side Indian culture learn to us love to alive (Person, Animals, Trees etc.) as well as every physical things (land, Hills, minerals etc.) according to Sant Dnyaneshwer in the Marathi Language भूता परस्पर जडो मैत्र जिवांचे "it means every person attach to physical and alive things of the world and environment. Also Sant Tukaram Maharaj told to us in his own words वृक्ष वल्ली आम्ही सोयरे ..."it means trees and things are our relative so that should love to them.

If maximum part of follows to the thoughts of above mentioned Sants and in traditions which are related to environment it will be helpful to conservation of environment. This pattern of consumption like private goods because every takes care to environment, so that naturally was in balanced. This all credit goes to our tradition alternatively goes to patter of consumption. In the flow of globalization consumption pattern is affected, hence environment also affected from consumption pattern. Obviously in the flow of globalization promoting to consumption so that every alive run to back to money and luxury consumption, alternatively industrialization also rapidly growing for complete human needs. Concept of development as a define "development is equivaile to industrialization" industrialization is irrationally going on the way globalization and it's adversely affecting to environment. Environmental means are scared of inadequate and human beings are unlimited so that day on day consumption pattern affecting to environment and due to that situation environmental system collapsing. That is only one reason we are consuming careless to environment as a public goods as well as there are various reasons like economic and noneconomic which are affecting to environment.

Unfortunately, situation going to changing, when we think about environment in this concept include the land, Water, Forest, Population these are very important factors which are affected to whole environmental system. When we compare on the bases of ration between above mentioned factor it adversely come on front side like India account for 18% of world population, about 4% of the worlds water resources and about 23% of the worlds forest. This is the very adverse situation about India and environment state.

Another side our nation's G.D.P is increasing, stoke of foreign currency is also increasing! But what is about our sustainability of environment? What is about our next generation? In the flow of economic development, we are avoiding to nature, we are extra emphasizing on industrialization for development hence whole alive affecting from global warming, climate change and other environment problems like Air, Noise, Water and soil pollution. We can call this development is not sustainable development. It is very harmful to our society, our next generation and planet. Why this situation creates? Why environment damaging? Why every alive is deprive form pure and healthy environment? All these questions answer is disguised in improper or inefficient consumption of environment!

In the present period we realize environment is a public goods. Because general psychology indicates irrational pattern about public goods, we are consuming because public goods with careless, inefficiently so that in the in competition of industrialization industrialists acquiring land and doing treeless land for established industries but unfortunately substitutive no more to tree plantation as well as another side every industry creates pollution like water, air, noise, land so that environment rapidly going to deprivation. In this situation many acts provided protection to environment but society is not follow to it another reason is lack of political willpower is also reason of degradation of environment.

Oppositely private goods we are uses with carefully because private goods which individual it we use very carefully and rationally because its are individual it we are not allow to other so these are durable. We have to give same treatment to environment (private goods) as private goods. As well as we have to suggest to other for proper and efficient use of environment and follow to environmental acts. At that we can achieve the concept of Sustainable development.

#### Conclusion:

We can say in short, an environment is a public goods but we have to need to consume to environment as a provide goods (with careful and efficient use) for the conservation of environment, healthy life, as well as sustainable development etc. so that everyone should have need to conserve to trees, water, land etc. and promote to renewable energy.
